Inference and prediction in human affairs are characterised by a cognitive and reactive sample space, the elements of which are aware both of the statistician and of each other. It is therefore not surprising that methodologies borrowed from classical statistics and the physical sciences have yielded disappointingly few lasting empirical insights and have sometimes failed in predictive mode.

Statistical Games and Human Affairs: The View from Within ...

Games have been an integral part of human affairs since the days of prehistoric egypt, and although they have continuously evolved since, they are arguably more pervasive than ever. Inference and prediction in human affairs are characterised by a cognitive and reactive sample space, the elements of which are aware both of the statistician and of each other.

This book puts the underlying methodology of socioeconomic statistics on a firmer footing by placing it within the ambit of inferential and predictive games. It covers such problems as learning, publication, non-response, strategic response, the nature and possibility of rational expectations, time inconsistency, intrinsic nonstationarity, and the existence of probabilities. An exciting account of how government statistics in developing countries are social artefacts dynamically shaped by political and economic contexts.

This book finds a broad domain of relevance in statistics and the social sciences. Its conceptual development is supported by applications to economics and income distribution, finance, education, demographics and actuarial science, political studies, psychology, and general statistics. Fresh perspectives on directional complexity have generated an informational theory of ‘more versus less’, with representative polar outcomes as good or bad, or rich or poor. New duality metrics for spread and asymmetry have resulted, motivated by internal perspectives on the part of subjects, such as attitudes to their comparative (dis)advantage. This book is a readable review of these developments. Concepts and applications are described in tandem with each other. They consolidate recent contributions to the research literature, augmented with fresh insights and applications. Dynamic extensions include modeling shifting social attitudes, while the broader agenda encompasses topical areas such as subjectivist probability, investment decision making, and income distribution.

Coughlin provides the most comprehensive and integrated analysis of probabilistic voting models available, also developing further his important contributions. Probabilistic voting theory is the mathematical theory of candidate behavior in or in anticipation of elections in which candidates are unsure what voters' preferences will be on all or most issues, which is true of most governmental elections. The theory asks first whether optimal candidate strategies can be determined, given uncertainty about voter preferences, and if so, what exactly those strategies are, given various circumstances. It allows the theorist to predict what public policies will be supported and what laws passed by elected officials when in office and what positions will be taken by them when running in elections. One of the leading contributors to this rapidly developing literature, which is at the leading edge of public choice theory, Coughlin both reviews the existing literature and presents new results that unify and extend developments in the theory that have been scattered in the literature.

The chief economist for the World Bank's Africa region, Shanta Devarajan, delivered a devastating assessment of the capacity of African states to measure development in his 2013 article "Africa's Statistical Tragedy". Is there a "statistical tragedy" unfolding in Africa now? If so then examining the roots of the problem of provision of statistics in poor economies is certainly of great importance. This book on measuring African development in the past and in the present draws on the historical experience of colonial French West Africa, Ghana, Sudan, Mauritania and Tanzania and the more contemporary experiences of Ethiopia and the Democratic Republic of Congo. The authors each reflect on the changing ways statistics represent African economies and how they are used to govern them. This bookw as published as a special issue of the Canadian Journal of Development Studies.

Economics originated as a branch of the humane studies that was concerned with trying to understand how some societies flourish while others stagnate, and also how once-flourishing societies could come to stagnate. Over the major part of the 20th century, however, economists mostly turned away from these humane and societal concerns by importing mechanistic ideas from 19th century physics. This book seeks to show how that original humane and social focus can be renewed. The many particular topics the book examines can be traced to two central ideas. Firstly, that economic theory, like physics, requires two distinct theoretical frameworks. One treats qualities that are invariant across time and place; this is the domain of equilibrium theory. The other treats the internal generation of change in societies through entrepreneurial action that continually transforms the ecology of enterprises that constitutes a society. Secondly, economic theory is treated as a genuine social science and not a science of rationality writ large. The book also explores ways in which life in society is understood differently once economics is treated as a social science. The book is much of the hyper-formality that comprises economic theory these days fails to make reasonable contact with reality. It will be of interest to sociologists, political scientists, and researchers in law, public policy, Austrian economics, evolutionary economics, institutional economics and political economy.

When John Maynard Keynes likened Jan Tinbergen's early work in econometrics to black magic and alchemy, he was expressing a widely held view of a new discipline. However, even after half a century of practical work and theorizing by some of the most accomplished social scientists, Keynes' comments are still repeated today. This book assesses the foundations and development of econometrics and sets out a basis for the reconstruction of the foundations of econometric inference by examining the various interpretations of probability theory which underlie econometrics. Keuzenkamp claims that the probabilistic foundations of econometrics are weak, and although econometric inferences may yield interesting knowledge, claims to be able to falsify or verify economic theories are unwarranted. Methodological falsificationism in econometrics is an illusion. Instead, it is argued, econometrics should locate itself in the tradition of positivism.

Although written as a textbook, the contents are research led, informed by the author's own extensive experience of undertaking ethnographic research in dangerous and sensitive locations in Northern Ireland and elsewhere.

This book explores the conceptual place of risk across a number of fields of law.

This five-part volume surveys the main ideas and contributions to the field of public choice.
